

Data Cleaning and Preprocessing

The dataset was obtained from Kaggle:

<https://www.kaggle.com/datasets/rohitgrewal/restaurant-sales-data>

The dataset contains restaurant sales data from a company operating across multiple cities. It includes information about individual sales transactions, customer demographics, and product details. The dataset consists of 254 rows and 10 columns.

Data Cleaning Steps

The following data cleaning and preprocessing steps were performed using Microsoft Excel Power Query:

- The CSV dataset was loaded into the Power Query Editor in Excel.
- Column names and data types were checked and verified.
- The data type of the Quantity column was changed to Whole Number.
- The dataset was checked for missing or empty values; no missing/empty cells were found.
- The dataset was checked for duplicate records; no duplicates were found.
- Text values were trimmed to remove unnecessary spaces.
- Unnecessary spaces in the Manager column were removed.
- Text values were standardized by capitalizing each word.
- Column Quality was checked to identify errors, null values, and empty values.
- The cleaned dataset was validated and confirmed to contain no errors, null values, or unexpected empty cells.
- Finally, the cleaned dataset was closed and loaded back into Excel.

The dataset is now cleaned, standardized, and ready for further analysis.
